Web Application Development

Practical 06

Create a Blog using HTML, CSS, and Javascript.

1. You can mention your blog name as a header.
2. The top of the webpage creates image galleries in a carousel format.
3. Add an image to the blog's left bottom corner and when you click the image it should move to the right bottom corner.
4. Add playing audio or video in the middle of the web page.
5. Put an image and increase and decrease the image size using JavaScript.
6. Add a "**Contact Us**" form at the end with Name, Telephone number, and email. Validate user inputs.

When you create the above blog, you can add CSS through inline CSS/internal CSS/External CSS. Besides above mention parts, you can add any other additional elements to your blog to make it user-friendly and add details (paragraph/sentences/tables) that are relevant to your blog.
